Problem Statement

“Air Pollution impacts climate change, public and individual health due to increasing **morbidity** and **mortality**. It accounts for about **9 million deaths** per year”

Short-term exposure to air pollutants is closely related to many chronic diseases and increased hospitalization

More serious due to **overpopulation, uncontrolled urbanization and industrialization** in countries such as **India (New Delhi)**. This leads to poor air quality, in countries with social disparities and a lack of information on sustainable management of the environment. ^[1]

The interactions between humans and their physical surroundings have been extensively studied

But...

- Existing systems do not take into consideration the existing health conditions of the individuals
- Existing networks have very high latency - short term exposure of PM_{2.5} can be deadly for people with dangerous health conditions

[1] <https://www.sciencedirect.com/science/article/abs/pii/S026974911930418X>

Our Solution

“AirQure” is a device with low-cost calibrated air quality sensors which is an intelligent and edge Computing based low latency and autonomous air quality system.

Features

Intelligent autonomous forecasting
using distributed DL model

Low latency information exchange
using ProjectAIR and edge

1

Personalised suggestions based for
each individual and integration with
Alexa/Smart Homes

2

3

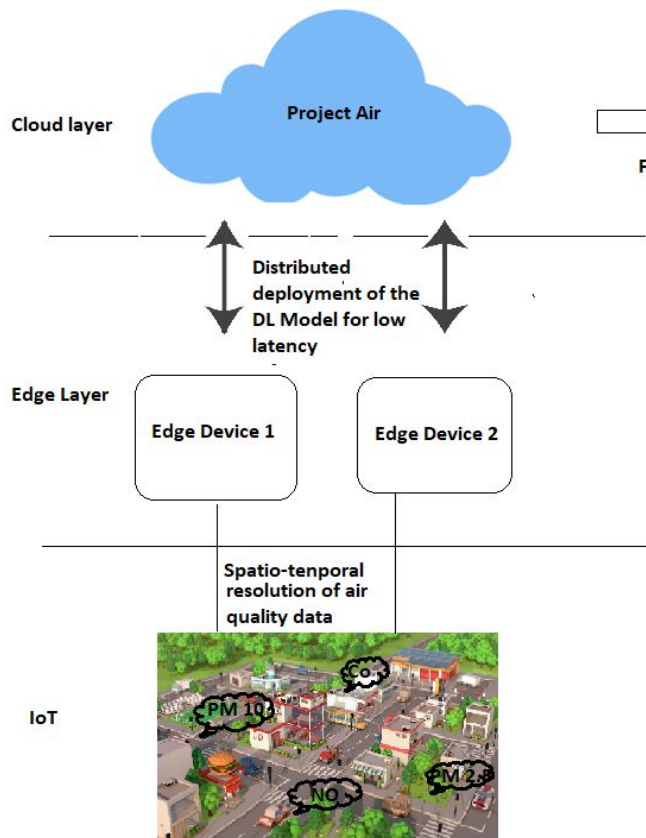

Community data fusion for improved
spatio-temporal resolution

4

5

Compact, low-cost, portable
hardware

High Level Approach

Forecasted data

Analysis of forecasted air quality data

Intelligent autonomous forecasting technique

Personalised suggestions for each individual

Actualizing the air purifiers/humidifiers

Easy Integration with Smart home system - Alexa/google

Business Feasibility

Purchase of device

Device Re-calibration
and maintenance plan

Data plan for personalised
suggestions

Data Fusion and availability of infrastructure
to the government authorities

Support for the already existing Air quality
measurement systems

How are we different?

- **Personalised model predictions** enables us give **personalised suggestions** to the individuals based on their health condition (**Even short term exposure** of PM is **deadly** for people with already existing chronic diseases like asthma)
- **Distributed deployment of DL** models enables us provide the **Low Latency** Air Quality Management and Analysis to the concerned pollution boards for necessary actions.
- **AirQure** will provide necessary suggestions and possible steps for individuals as well as authorities to mitigate the **peak deterioration** of air quality during certain months, using periodic and seasonal forecasting methods.
- **AirQure** would aim to provide **high accuracy and precise forecasted data** for over **24 hours** with high temporal resolution and over seasons with higher accuracy and maximum possible temporal resolution.

Thank you
